abstract: The function output iterator adaptor makes it easier to create custom output iterators. The adaptor takes a unary function and creates a model of Output Iterator. Each item assigned to the output iterator is passed as an argument to the unary function. The motivation for this iterator is that creating a conforming output iterator is non-trivial, particularly because the proper implementation usually requires a proxy object.

[function_output_iterator requirements](#)

[function_output_iterator models](#)

[function_output_iterator operations](#)

[Example](#)

```
template <class UnaryFunction>
class function_output_iterator {
public:
    typedef std::output_iterator_tag iterator_category;
    typedef void               value_type;
    typedef void               difference_type;
    typedef void               pointer;
    typedef void               reference;

    explicit function_output_iterator();

    explicit function_output_iterator(const UnaryFunction& f);

    /* see below */ operator*();
    function_output_iterator& operator++();
    function_output_iterator& operator++(int);
private:
    UnaryFunction m_f;      // exposition only
};
```

function_output_iterator requirements

UnaryFunction must be Assignable and Copy Constructible.

function_output_iterator models

function_output_iterator is a model of the Writable and Incrementable Iterator concepts.

function_output_iterator operations

```
explicit function_output_iterator(const UnaryFunction& f = UnaryFunction());
```

Effects: Constructs an instance of `function_output_iterator` with `m_f` constructed from `f`.

`operator*();`

Returns: An object `r` of unspecified type such that `r = t` is equivalent to `m_f(t)` for all `t`.

`function_output_iterator& operator++();`

Returns: `*this`

`function_output_iterator& operator++(int);`

Returns: `*this`

Example

```
struct string_appender
{
    string_appender(std::string& s)
        : m_str(&s)
    {}

    void operator()(const std::string& x) const
    {
        *m_str += x;
    }

    std::string* m_str;
};

int main(int, char*[])
{
    std::vector<std::string> x;
    x.push_back("hello");
    x.push_back(" ");
    x.push_back("world");
    x.push_back("!");

    std::string s = "";
    std::copy(x.begin(), x.end(),
              boost::make_function_output_iterator(string_appender(s)));

    std::cout << s << std::endl;

    return 0;
}
```
